

Customer Lead-in Kit

Design

The lead in unit is a compact and fast module designed to provide a protected entrance to customers premises. Routing from a vertical cable run to a horizontal transition through a wall can introduce losses onto a fibre optic cable.

The lead in has radius protection that prevents any harsh bends beyond the limits of fibre drop cables from Hexatronic.

It can safely accommodate fibre cables up to a 5mm in diameter. The covers are supplied in grey for external use and white for internal use.

Application

Protected cable entry location to customer premises.

Features

- Compact + discrete
- Multifunctional
- Impact resistant
